

## SDS 321: Practice midterm

*Note: This practice exam is longer than your actual exam will be! The actual exam will be 5 questions*

1. Find a formula for the probability that among a set of  $n$  people, **at least two have their birthdays in the same month** of the year (assuming the months are equally likely for birthdays). Assume  $n \leq 12$  (for  $n > 13$  the probability is equal to 1.0).
2. How many ways can we arrange the letters of the word “ALPHABET” so that the first and last letters are vowels?
3. If a coin is tossed a sequence of times (infinitely many times), what is the probability that the first head will occur **after** the 5th toss, given that it has not occurred in the first 2 tosses?
4. A continuous random variable has PDF

$$f_X(x) = \begin{cases} a + bx^2 & 0 < x < 1 \\ 0 & \text{otherwise} \end{cases}$$

- (a) If  $E[X] = \frac{3}{5}$ , find  $a$  and  $b$ .
  - (b) What is  $\text{var}(X)$ ? If you couldn't find  $a$  and  $b$ , you can leave them as algebraic variables.
  - (c) If  $X$  and  $Y$  are continuous random variables, show that, if  $X$  and  $Y$  are not independent,  $\text{var}(X + Y) = \text{var}(X) + \text{var}(Y) + 2(E[XY] - E[X]E[Y])$ .
5.  $X$  is a normal random variable with mean 20 and variance 9.
    - (a) Write  $\mathbf{P}(X \leq 10)$  in terms of the standard normal distribution, and use the attached standard normal table to find  $\mathbf{P}(X \leq 10)$
    - (b) Write  $\mathbf{P}(15 \leq X \leq 20)$  in terms of the standard normal distribution, and use the attached standard normal table to find  $\mathbf{P}(15 \leq X \leq 20)$ .
    - (c) If  $Y$  is a normal random variable with mean 2 and variance 12, what is the mean and variance of  $Z = 2X + Y + 3$ ?

6. On average, 3 traffic accidents occur in a given city per day. You may assume that the number of accidents follows a Poisson distribution with  $\lambda = 3$ . Recall that the PMF for the Poisson distribution is  $p_X(k) = \frac{\lambda^k e^{-\lambda}}{k!}$ .
- What is the probability that we see at least three accidents in a day?
  - If you know there is at least one accident, what is the probability that the total number of accidents is at least three?
7. A continuous r.v.  $X$  has density function

$$f(x) = c e^{-|x|} = \begin{cases} c e^{-x} & x \geq 0 \\ c e^x & x < 0 \end{cases}$$

- Find  $c$ .
  - Find  $p(|X| < 2)$ .
  - Find  $E(X)$  (*Hint*: no integral required).
8. Charles claims that he can distinguish between whisky and brandy 75% of the time. Let  $p$  = Charles' probability of distinguishing the drinks. Charles' claim is  $p = p_C = 0.75$ . Ruth bets that he cannot tell the difference and, in fact, just guesses. That is, Ruth's claim is  $p = p_R 0.5$ . To settle this, a bet is made: Charles is to be given  $n = 5$  small glasses, each having been filled with whisky or brandy, chosen by tossing a fair coin. He wins the bet if he gets **4 or more** correct.
- If Charles is correct—i.e. if  $p = p_C = 0.75$ —what is the probability that Charles wins the bet.
  - If Ruth is correct—i.e. if Charles is guessing randomly—what is the probability that Charles wins the bet.
  - Assume that, before seeing the outcome of the bet, you believe that Charles is right with probability 0.1, and Ruth is right with probability 0.9. I find out that Charles won the bet. With what probability should I believe Charles is right?
