## Convex Lipschitz functions of bounded random variables

#### **Theorem**

Consider a convex function  $f: \mathbb{R}^n \to \mathbb{R}$  with Lipschitz constant L. Also consider n iid random variables  $X_1, \ldots, X_n \in \{-1, 1\}$ . We have for t > 0

$$P(|f(X) - M_f| \ge t) \le 4 \exp\left(-\frac{t^2}{16L^2}\right),$$

where  $M_f$  is the median of f.

 Often the median can be replaced by the mean with a little give in the t.

1

## From convex Lipschitz functions to sets

- Let d denote the Euclidean distance
- Define  $A = \{x : f(x) \le M_f\}$
- Define  $d(x, A) = \inf_{y \in A} d(x, y)$
- Define  $A_t = \{x : d(x, A) \le t\}$
- Since f is 1 Lipschitz (WLOG),  $x \in A_t \Rightarrow f(x) \leq M_f + t$
- So  $P(x \in A_t) \le P(f(x) \le M_f + t)$
- All we need is to upper bound  $P(x \notin A_t)$
- Since f is convex, A is a convex set.

# Talagrand's inequality: original statement

#### **Theorem**

Let  $A \subset \mathbb{R}^n$  be a convex set. Then,

$$P(X \in A)P(X \notin A_t) \leq e^{-t^2/16}$$
.

• This is basically saying that if A is convex and and  $P(x \in A)$  is large then  $A_t$  takes up most of the space in the unit hypercube for  $t \gg 1$ .

## Is convexity needed?

#### **Example**

Let  $A:=\{x\in\{0,1\}^n:\sum_{i=1}^nx_i\leq n/2\}$ . Consider a product measure such that  $X_i\sim Bernoulli(1/2)$ . Let  $X=(X_1,\ldots,X_n)$ . Then  $P(X\in A)$  is large. But is  $P(X\not\in A_t)$  large?

- Note that A is not convex.
- Also see that

$$|y^{T}1 - x^{T}1| \le ||y - x||_{1} = ||y - x||_{2}^{2}$$
  
 $\{y \in A_{t}\} \subseteq \{y^{T}1 \le n/2 + t^{2}\}$   
 $P(Y \notin A_{t}) \ge P(Y^{T}1 \ge n/2 + t^{2})$ 

- Now  $P(X \not\in A_t)$ , which is large for  $t \approx (\log n)^{1/4}$ , contrary to the result of Talagrand.
- What if we define A as a subset of  $[-1,1]^n$ ?

4

#### Is convexity needed?

- Now A is convex.
- Distance to A of a point with more than n/2 ones is simply its distance to the hyperplane  $x^T 1 n/2 = 0$
- Consider a point y with n/2 + k ones.
- The distance to the previous nonconvex A is  $\sqrt{k}$
- But distance to the convex A is  $|y^T 1 n/2|/\sqrt{n} = k/\sqrt{n}$

$$\{y \in A_t^{(conv)}\} \subseteq \{y \in A_{t^{1/2}n^{1/4}}\} \subseteq \{y^T 1 \le n/2 + t\sqrt{n}\}\$$
  
 $P(Y \in A_t) \ge P(Y^T 1 \le n/2 + t\sqrt{n})$ 

• Here, everything is fine since this is indeed large when  $t\gg 1$ 

#### How about Azuma Hoeffding or McDiarmid?

- Let f is convex and one Lipschitz. Also, say E[f(X)] was equal to the median.
- Note that in our setting,  $|f(x) f(y)| \le 2$  when x, y differ in one coordinate.
- So using McDiarmid's inequality gives

$$P(|f(X) - E[f(X)]| \ge t) \le 2 \exp\left(-\frac{2t^2}{4n}\right),$$

- i.e. it gives concentration when  $t \gg \sqrt{n}$ .
- But Talagrand's inequality gives

$$P(|f(X) - E[f(X)]| \ge t) \le 4 \exp\left(-\frac{t^2}{16}\right)$$

• i.e. it gives concentration when  $t\gg 1$ .  $(X\gg 1 \text{ implies } X \text{ has factors logarithmic in } n)$ 

## Going from median to expectation

- First note that  $E[(f(X) M_f)^2] \le CL^2$  by using Talagrand's inequality. (How?)
- Now note that  $var(f(X)) \le E[(f(X) M_f)^2] \le CL^2$
- Finally  $E[|f(X) E[f(X)]| \ge 2\sqrt{\text{var}(f(X))}] \le 1/4$ .
- So we must have  $M_f \in [E[f(X)] \pm cL]$
- So,  $P(|f(X) E[f(X)]| \ge cL + t) \le 4e^{-t^2/16L^2}$

## Operator norm of random matrices

#### **Example**

Consider a random matrix  $M = [X_{ij}] \in [a, b]^{n \times m}$  where  $X_{ij}$  are independent random variables.

$$P(\|M\|_{op} \ge E[\|M\|_{op}] + c\sqrt{\log n}) = o(1)$$

- For  $E[X_{ij}] = 0$  and  $var(X_{ij}) = \sigma^2$ , it can be shown that  $E[\|M\|_{OP}] \le 2\sigma\sqrt{n}$ .
- $||M||_{op}$  is 1 Lipschitz and convex. (how?)

## Operator norm of random matrices

#### **Example**

Consider a random matrix  $M = [X_{ij}] \in [a, b]^{n \times m}$  where  $X_{ij}$  are independent random variables.

$$P(\|M\|_{op} \ge E[\|M\|_{op}] + c\sqrt{\log n}) = o(1)$$

- For  $E[X_{ij}] = 0$  and  $var(X_{ij}) = \sigma^2$ , it can be shown that  $E[\|M\|_{OP}] \le 2\sigma\sqrt{n}$ .
- $||M||_{op}$  is 1 Lipschitz and convex. (how?)

## Complexity

#### **Example**

Consider a iid sequence  $X = \{X_i\}_{i=1}^n$ . We will bound  $f(X) := \sup_{a \in \mathcal{A}} a^T X$  where  $\mathcal{A}$  is a compact subset of  $\mathbb{R}^n$  such that  $\mathcal{W} = \sup_{a \in \mathcal{A}} \|a\|_2 < \infty$ .

- Why cant we just use Chernoff?
- First let us check if f(X) is Lipschitz. Let a\* and a\* be the
  maximizers of f(X) and f(X').

$$f(X) - f(X') = a_*^T X - a_*'^T X' \le a_*^T (X - X')$$

$$\le \sup_{a \in \mathcal{A}} a^T (X - X') \le \mathcal{W} \|X - X'\|_2$$

- How about convex? Consider the set  $S_c = \{x : f(x) \le c\}$ .
  - consider  $x, y \in S_c$ . Then

$$f(\lambda x + (1 - \lambda)y) \le f(\lambda x) + f((1 - \lambda)y) \le c$$

## Complexity

#### **Example**

Consider a iid sequence  $X = \{X_i\}_{i=1}^n$ . We will bound  $f(X) := \sup_{a \in \mathcal{A}} a^T X$  where  $\mathcal{A}$  is a compact subset of  $\mathbb{R}^n$  such that  $\mathcal{W} = \sup_{a \in \mathcal{A}} \|a\|_2 < \infty$ .

- If  $X_i \sim N(0,1)$  using Gaussian+Lipschtz  $P(|f(X) E[f(X)]| \ge t) \le 2e^{-\frac{t^2}{2W^2}}$
- If  $X_i$  are bounded, then Talagrand gives us the same thing (modulo constants).
- How about McDiarmid?

# Complexity

#### **Example**

Consider a iid Rademacher sequence  $X = \{X_i\}_{i=1}^n$ . We will bound  $f(X) := \sup_{a \in \mathcal{A}} a^T X$  where  $\mathcal{A}$  is a compact subset of  $\mathbb{R}^n$  such that  $\mathcal{W} = \sup_{a \in \mathcal{A}} \|a\|_2 < \infty$ .

• Consider X and X' differing in the k-th coordinate,

$$f(X) - f(X') = a_*^T X - a_*'^T X' \le a_*^T (X - X')$$
  
$$\le \sup_{a \in \mathcal{A}} a_k (X(k) - X'(k)) \le \sup_{a \in \mathcal{A}} |a_k|$$

So McDiarmid gives:

$$P(|f(X) - E[f(X)]| \ge t) \le 2 \exp(-\frac{t^2}{2 \sum_{i} \sup_{a \in \mathcal{A}} |a_i|^2})$$
